

PKL BOX DUPR Engine

A simple guide to running open play: from first player to final scores.

What is it?

The DUPR Engine is a web page that handles the boring parts of open play. It **groups players** into matches, keeps a **waiting line**, shows who plays on **which court**, records **scores**, and gives you a file you can upload to **DUPR** at the end. A TV display shows everyone what is happening.

The whole day in 6 steps

1 · Participants

2 · Match Suggestions

3 · Queue & Courts

4 · Leaderboard

Logs

Use the numbered tabs at the top from left to right. Most days you go through them in order.

1 Start a session

- Press **New session**. It asks if you want to save a snapshot first, then clears everything for a fresh day.
- Open the **Logs** tab and press **DUPR settings**. Type the event name, date and location. Choose the scoring type (SIDEOUT or RALLY). This is used in your DUPR file and scoresheet.

2 Make buckets (groups of players)

- Go to **1 · Participants** and press **+ Add bucket**. A bucket is a group that plays together, for example “Beginners” or “Advanced”.
- Give it a name and pick **Singles** (1 vs 1) or **Doubles** (2 vs 2). You cannot change this later.
- Tick the **courts** this bucket may use. Every bucket has its own leaderboard and logs.

3 Add the players

- Press **From CCPC Members Database** to search members by name. Their DUPR rating is filled in for you. Choose the players, then **Add to bucket**.
- For visitors, type their name under **Guest** and press **+ Add guest to list**.
- If you use the check-in tablet (kiosk), players can sign themselves in. If the same person signs in twice, both entries get a colored mark so you can spot the duplicate.
- A player can be set to **rest** (pause button) when they need a break, and brought back with the play button later.

4 Create matches

- Open **2 · Match Suggestions** and press **Generate matchups**. The engine mixes partners and opponents so people do not keep playing the same ones, and rotates who sits out.
- Next to each name you will see **Played** (finished games) and how many games are already waiting in line.
- Happy with the list? Press **Add to queue** for one match or **Add all to queue** for the whole round.
- Want a specific match? Press **Custom match**, pick the players yourself, then add it to the queue.

Tip: Nothing starts by itself. You are always in control of when a match goes to a court and when it begins.

Running the courts

5 Queue & Courts

- Open **3 · Queue & Courts**. First press **Activate Courts (ALL)**. This starts the session clocks. Before this, you cannot send matches to a court.
- Each match in the **Waiting queue** can be moved with the ▲ ▼ arrows or by dragging. Use **Add to court** to put a match on an open court (or drag it there).
- Press **Call players** so their names pop up on the TV, then **Start game** when they are ready. The game timer starts.
- Need a pause? Use **Hold**. A held match stays in the line (and on the TV marked “On Hold”) until you press the play button.
- Mistake in a lineup? Use **Replace** to swap one player for another from the same bucket.
- **Optimize queue** reshuffles the waiting matches so players are not stuck playing back-to-back and buckets take turns. It shows a preview first, and you can **Undo optimize**.
- **Clear queue** removes all waiting matches. **Flip courts** reverses the court order on your screen.

6 Finish a match and show the TV

- When the game ends, press **End match**, type both scores and press **Confirm result**. Ties are not allowed. A winner pop-up shows on the TV, and the players go back to the pool.
- Open **4 · Leaderboard** to see wins, points and point difference for the current session, per bucket.
- Use **Show leaderboard** to put the top players on the TV. Use the **Display Queue** switch to show or hide the waiting list on the TV (hidden = bigger court cards).

After the games

- **Logs** tab: every finished match. Filter by bucket or search a name. Wrong score? Use the pencil (✎) to fix it. The leaderboard updates by itself.
- **Export DUPR CSV**: downloads all finished matches in the DUPR upload format. Check that every player has a DUPR ID.
- **Export Scoresheet (PDF)**: prints a paper sheet of all matches in the session with blank score boxes, in case you want a paper backup.
- **Snapshots**: saves a copy of the whole session. You can restore it if something goes wrong.

Good to know: a bucket can only be deleted after it has no players, and players can only be cleared once the queue is empty. If the screen looks stuck, check the little “syncing” badge. It means the page is still sending data to the internet, so keep the connection on.
